CC leukocyte trafficking, for treating CCR2-mediated disorders such as criminating contributions of the minimum disorders such as rheumatoid contributions and multiple sclerosis, atherogenesis and atherosclerosis. CC and for inhibiting restenosis. They are useful in therapy or diagnosis. CC and in the manufacture of a medicament for treating CCR-2 mediated CC disease. They are also useful for treating allergy, anaphylaxis, CC malignancy, chronic and acute inflammation, histanine and IgE-mediated allergic reaction, shock, stenosis, allograft rejection, CC fibrotic disease, asthma, inflammatory glomerulopathies, acquired CC immune deficiency syndrome (AIDS), restenosis associated with vascular intervention, including angioplasty and/or stent placement in a mammal. CC Humanised antibodies are also useful for inhibiting narrowing of the CC lumen of a vessel in a mammal, and inhibiting neointimal hyperplasia of CC a vessel in a mammal, preferably associated with vascular intervention. CC The present sequence is a DNA encoding humanised murine antibody heavy Chain regions, ID9RHA. ID9RHA sequence consist of the complementarity CC chain region, ID9RHA. ID9RHA sequence consist of the complementarity catermining regions (CDRs) of the murine ID9 antibody heavy chain cc variable (VH) region genetically inserted into the framework regions of the murine ID9 antibody heavy chain complementarity consists of the murine ID9 antibody heavy chain regions of the murine ID9 antibody heavy chain complementarity of the complementarity complementar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin

                                                                                                                                                  This invention describes a novel method for the detection of a mammalian CC infection by an acid-resistant microorganism (A) by treating a faecal CC sample with at least two different monoclonal antibodies (MAb) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting CC formation of a complex (C) between (I) and the corresponding antigen of CC (A). The first and second (I) bind to epitopes of different antigens CC (A). The first and second (I) bind to epitopes of different antigens CC (in at least some mammals, and have either: (i) their native structure; CC or (ii) a structure against which an antibody is produced by an animal CC infected or immunized with (A), or its extract, lysate, derived protein CC or fragment, or with a synthetic peptide. Practically all mammals display CC at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, CC Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, CC interapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This could be compared to the method of the invention.

The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components.
The present sequence represents the heavy chain variable region for monoclonal antibody (MAb) 284, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridoma cells. The protein can be used for binding heavy metals, such as lead cations.
                                                                                                                                                                 DNA encoding heavy metal bir detecting, removing, adding

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting leukocyte trafficking, for treating CCR2-mediated disorders such as inflammatory disorders autolimmuno disorders such as channes tid

inflammatory disorder, autoimmune disorders such as arthritis and multiple sclerosis, atherogenesis and

atherosclerosis rheumatoid

They are useful in therapy or diagnosis, and in the manufacture of a medicament for treating CCR-2 mediated disease. They are also useful for treating allergy, anaphylaxis, malignancy, chronic and acute inflammation, histamine and iggmention, choose a state of the state of
                            The patent discloses a novel retroviral vector, particularly Spleen Necrosis Virus (SNV) vector, having target cell specificity. The vector has a targetting envelope which is a chimeric protein consisting of an antigen binding site of an antibody (e.g. anti-DNP-scFv) or another peptide that binds to a specific cell surface protein, fused to the carboxy terminal part of the retroviral envelope protein. The presence of the wild type envelope protein serves as a helper molecule to improve or supplement a functional membrane fusion domain. The antigen binding site replaces the natural viral receptor binding site. The retroviral vector is used for cell specific gene transfer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Retroviral vector; cell specific gene transfer; Spleen Necrosis Virus; SNV; antibody-envelope fusion protein; retroviral envelope protein; gene therapy; antigen binding site; single chain antibody; human; Her2neu cell surface marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cell specific gene transfer using antibody-envelope fusion proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-PSDB;
